

# Gitanyow *Fisheries* Authority

October 15, 2019

## **2019 Kitwanga River Salmon Enumeration Facility Update #13**

The Gitanyow Fisheries Authority (GFA) is pleased to announce that the Kitwanga River Adult Salmon Enumeration Facility (KSEF) is operational for 2019. Like in other years GFA will be providing weekly updates on salmon escapement to the Kitwanga River (middle Skeena index) from July through to October. This year marks the 17<sup>th</sup> consecutive year that GFA has implemented the program, which collects important in-season pacific salmon stock assessment and biological information. GFA would like to thank their 2019 funders and supporters, specifically the Gitanyow Chiefs (Gitanyow Huwilt Sustainability Fund), the Pacific Salmon Commission and Fisheries and Oceans Canada. GFA would also like to acknowledge and thank the Gitwankak Wilt Simadeeks for allowing GFA to continue to work within their traditional territory, as set out by our 2002 agreement.

As in other years, weekly updates will be distributed and posted on our website:

GFA staff installed the in-river KSEF components from July 8-11, 2019 under normal water level conditions. The fence was operational (diverting fish through sample boxes) on the afternoon of July 11, which is within our usual starting time for the project.

The water level at the KSEF is currently at 0.67m, approximately 0.12m lower than the long-term average (using 2004-2017, see KSEF water stage graph below for more detail). Water temperatures in the Kitwanga River are colder for this time of year when compared with 2004-2017 averages, and are currently fluctuating between 2-6 °C. Total salmon counts to the end of **October 14, 2019** are as follows:

**Sockeye = 119   Chinook = 654   Pink = 52,644   Chum = 492   Coho = 1,279**

To date we have counted **119 sockeye** through the KSEF. This year's sockeye escapement compares to a previous **maximum** observed to the day of 20,804 in 2010, which resulted in an overall escapement of 20,804 and the **minimum** observed to the day of 240 in 2007, which resulted in an overall escapement of 240. Based on average run timing for Kitwanga sockeye to the day (2003-2018) it is predicted that approximately **92%** of the run should have passed the KSEF. For more information on cumulative Kitwanga sockeye salmon abundance by day, refer to the sockeye salmon graph below.

We counted **654 Chinook** through the KSEF in 2019, which compares to a **maximum** observed of 3,225 in 2007 and to a **minimum** observed of 585 in 2017. Based on average run timing for Kitwanga Chinook to the day (2003-2018) it is predicted that **all** of the run should have passed the KSEF. For more information on cumulative Kitwanga Chinook salmon abundance by date, refer to the Chinook graph below.

In 2019, we are once again operating a digital video camera recorder (DVR). The DVR camera box has been in place and operational since July 17, 2019 and has been passing all species successfully. As was the case last season, fish seem more comfortable moving through the camera box than through our regular sample box areas. A second camera box has been added to the right bank side of our fence and is providing excellent viewing for counting fish.

*View of coho salmon (CWT clipped on left and unclipped on right) through new camera box on right bank of KSEF*

We counted **52,644 pink** salmon through the KSEF in 2019, which compares to an odd-year **maximum** observed of 559,865 in 2009, and to a **minimum** observed of 68,410 in 2011. Based on average run timing for pink salmon to the day (2003-2017), it is predicted that **all** of the run should have passed the KSEF. For more information on cumulative Kitwanga odd year pink salmon abundance by date, refer to the pink salmon graph below.

We counted **492 chum salmon** through the KSEF in 2019, which compares to a **maximum** observed of 1,862 in 2005, and to a **minimum** observed of 150 in 2008. Based on average

run timing for chum salmon to the day (2003-2018), it is predicted that **all** of the run should have passed the KSEF. For more information on cumulative Kitwanga chum salmon abundance by date, refer to the chum salmon graph below.

To date we have counted **1,279 coho salmon** through the KSEF. This year's coho escapement compares to a **maximum** observed to the day of 9,039 in 2009, which resulted in an overall escapement of 12,080 and the **minimum** observed to the day of 68 in 2018, which resulted in an overall escapement of 551 for the year. Based on average run timing for coho salmon to the day (2003-2018) it is predicted that approximately **86%** of the run should now have passed the KSEF. For more information on cumulative Kitwanga coho salmon abundance by date, refer to the coho salmon graph below.
